

Peer review workshop 2

I found a few minor bugs while running the program, first when creating a boat with length 100 the length is displayed as null. The other bug i found was when i asked to view member n+1 first then member n the program crashed.(n=maximum indexed member)

I had problem running the jar file(probably my fault), but it was easy to copy and compile it from Eclipse IDE.

The architecture seams fine, exept i that i think there should be a an interface to separate the view. The code looks fine, exept maybe the `while (1 == 1)` inside the controller, according to Johan Hagelbäck's feedback from my assignments in the introductioncourse the always true loops are a bad thing.(I still like them), and also the method Show in in controller should be split imo. The class diagram looks fine, but the sequence diagram looked a bit confusing when the lines crosses, so i think it would look better if the controler and console column switced places.

I liked the xml database. The things i would change is implement a interface.

I think this assignment needs a few minor changes to pass grade 2.
